MILO AI — CLINICAL SUMMARY

Confidence
88%

AI · Verify

4yo MN Maltese, otherwise healthy. **Active concern:** intermittent pruritus on ventral abdomen and paws over the past ~10 weeks, suspected food-related given symptom reduction on chicken-free elimination trial (started 08 Feb 2026). Owner reports chicken-containing treat re-exposure followed by flare on 22 Mar. **Weight stable** (5.4–5.7 kg over 12 months). **Vaccines current** through 2028 (DHPP, Rabies) and 2026 (Bordetella, Lepto). No medications beyond monthly heartworm preventative. Last wellness exam 10 Oct 2025 — unremarkable aside from mild dental tartar (Grade 1).

CYTOLOGY – PAW (L FOREFOOT)

Malassezia **Mild** — **PRESENT**

Treated with chlorhexidine/miconazole mousse 2x/wk
x 3 wk.

Confidence 91% AI · Verify

Mild eosinophilia ($1.4 \times 10^9/L$, ref 0.0–1.2) in context of concurrent dermatologic workup is consistent with an allergic or parasitic etiology. Parasitic disease considered unlikely on exam/skin scrape. No evidence of systemic inflammation, hepatic, or renal dysfunction. *AI interpretation — not a substitute for clinical judgment.*
